## In the Claims

(Currently Amended) A switch circuit comprising:
a first circuit portion corresponding to a first input port;
a second circuit portion corresponding to a second input port; and
an output port,

wherein each of the first and second circuit portions include at least one first transistor providing a portion of an isolation channel, at least one second transistor providing a portion of a transmit channel, and at least two third transistors for providing a control bias for selecting either the transmit channel or the isolation channel; and

wherein each third transistor of the first circuit portion is coupled at its base to a base of a corresponding third transistor of the second circuit portion, and to a control voltage source.

- 2. (Original) The switch circuit of claim 1, wherein the circuit is formed as an integrated circuit.
- 3. (Currently Amended) The switch circuit of claim 1, wherein the at least two third transistors of each of the first and second circuit portions provides a control bias for selecting which of the first and second input ports are coupled to the output port.
- 4. (Original) The switch circuit of claim 1, wherein the at least one first transistor comprises two transistors and the at least one second transistor comprises two transistors.
